Phagemids were plated and picked at the Clemson University Genomics Institute (CUG1) (Begum, Palmer, Frisch, Atkins and Wing). Plasmid DNA preparations, DNA sequencing and sequence analysis were performed at CUGI (Wing, Yu, Frisch, Henry, Simmons, Oates, Rambo, Main). The sequence has been trimmed to remove vector sequence and contains a minimum of 100 bases of phred value 20 or above. For more details on library preparation and

The present invention relates to a new immunoassay solid support consisting essential; of at least one hepatitis C virus (HCV) NS3/4a conformational epitope and a multiple epitope fusion antigen (MEFA), bound to the support. The NS3/4a conformational epitope and/or MEFA reacts specifically with anti-HCV antibodies present in a biological sample from an HCV-infected individual. The immunoassay of the invention is useful for detecting hepatitis C virus infection in a biological sample. The method of the invention provides a sensitive, accurate diagnostic and prognostic tool to provide adequate patient care and to

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            ATGCCCCCATCACGCCGTACGCCCAGCAGAGGGGCCTCCTAGGGTGCATAATCACC 60
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               The present invention relates to hepatitis C virus (RCV) core antisen and NS (nonstructural) 3/4a antibody combination assay that can detect both HCV antigens and antibodies present in a sample using a simile solid matrix as well as immunoassay solid supports for use in the assay. The solid support is useful for detecting HCV infection in a blockgical sample. The present sequence is a DNA encoding HCV-I NS3/4a mutant conformational antigen. This sequence is used in the exemplification
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  MetalaprolleThralaTyralaGlnGlnThrargGlv.cuLeuGlyCyslleTleThr

prevent transmission of RCV by blood and by blood products, or by personal contact. Use of NS3/4a conformational epitope in combination with MSFA, provides a sensitive and reliable method for detecting early HCV seroconversion. Use of MEKP has the added advantages of decreasing masking problems, improving sensitivity in detecting antibodies by substrate, and improving sensitivity in detecting antibodies by substrate, and improving substrate. Detection accuracy is increased and the incidence of faise results is reduced because of the identification and the use of faighty immissional might antiques within are present during the early stages of fic seroconversion. The present during the early stages of fic seroconversion. The present cutched sequence encodes the non-structural protein NSS/4a conformational epitope of the 8. The present invention relates to immunoassays comprising Hepatitis C Virus (MCV) NS3/4a conformational epicope and multiple epitope fusion antigen (MERA), bound to a solid support. The epitope and/or the multiple epitope fusion antigen react with anti-HCV antibodies present in a biological sample from an HCV-infecred individual. The immunoassays and methods of the invention are useful for detecting HCV infection in a biological sample. The inventive immunoassay solid support provides a sonsitive and reliable method for detecting early HCV seroconversion. The assays can detect HCV infection caused by any SIX known genetypes of HCV. The use of the multiple epitope fusion proteins decreases masking problems, improves sensitivity in detecting antibodies by allowing a greater number of epitopes on a unit area of substrate, and improves selectivity. The present sequence encodes HCV type I (HCV-I) NS3/4a conformational antigen, a mutant of Immunoassay solid support for detecting Hepatitis C Virus infection in biological samples, comprises Hepatitis C Virus conformational epitope ä NS3/4a conformational epitopq: multiple epitope fusion antigen; MEFA; anti-ECV antibody: NS3/4a conformational antigen; HCV infection; mutant; gene; ds. 11.35 a Goodberstranged nucleoticus equinates of the Goodbers standing through clones 14i, 11b, 7f, 7e, 8h 33c, 40b, 37b, 35 a 81, 32, 33b, 25c, 14c, 8f 33f, 33g and 39c of hepatitis C virus (HCV) bonA. In creating the composite sequence the following heterogeneities were considered. Clone 33c as well as in 5 other overlapping clones, nucleotide #78g is a G. However, in clone 37b the corresponding nucleotide is an A. This heterogenity may have important ramifications for protein folding.

Conclude 33c, as well as in 5 other overlapping clones, nucleotide #78g is a G. However, in clone 37b the corresponding nucleotide is an A. This heterogenity may have important ramifications for protein folding.

Conclude 33c an A. Therefore the residue in clone 7e and in 3 other overlapping clones is an A. Therefore the residue in clone 33f is represented as a T. Conclude 1. The 3' terminal sequence of clone 33f is coverlapping clones is a T. The 3' terminal sequence of clone 33f is coverlapping clones is a T. The 3' terminal sequence of clone 33f is coverlapping clones is a T. The 3' terminal sequence of clone 33f is conclude as T. The 3' terminal sequence of clone 33f is conclude 33f and in 2 other overlapping clones is an A. The 3' terminal sequence of clone 33f and in 2 other overlapping clones is an A. The 3' terminal sequence of clone 31f and 2 other overlapping clones is an A. The 3' terminal clone 33f and 2 other overlapping clones is an A. The 3' terminal sequence of clone 3' the accuse the corresponding disucleotide in clone 3' therefore the new or clone of clone 11 is depicted and instead the overlapping of clone 3' terminal residue and instead the overlapping of clone 3' terminal residue and instead and instead the overlapping of clone 3' terminal residue and instead in corresponding incontant in configurations of multiple and instead an
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   the corresponding sequences in con-5'-terminal regions of multiple overlapping clones are shown. AAN92097 could be used as a source of oligomeric DNA hybridisation probes to detect the presence of HCV mucialc acids in samples. The polypeptide(s) it encodes could be used
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               immuno- assay reagents and vaccines and to generate antibodies useful diagnosis and passive immunotherapy for HCV infection/non-A, non-B
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      1 MetAlaProlleThrAlaTyrAlaGlnGlnThrArgGlyLeuLeuGlyCysIleIleThr
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         21 Seri.cuThrGlyArgAspLysAsnGlnValGluGlyGluValGln1leValSerThrAla

The cDNA encodes antigens which react with antibodies in patients with non-A non-B hepatitis (NANRH). The cDNA can be used to design probes, or to synthesise polypeptides, which are used to diagnose HCV-induced NANBH,
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Hepatitis C virus gene - used for prodn. Of polynucleotide probes, polypeptide(s) and antibodies for diagnosis, prevention and treatment of infection.
                                                                                                                                                                                                                                                                                                                               Repatitis C virus: composite cDNA; probe; vaccine

It can be used to make oligomeric DNA hybridisation probes to detect the presence of HCV nucleic acids in samples. The polypeptide(s) it encodes could be used as immunoassay reagents and vaccines and to generate antibodies useful in diagnosis and passive immunotherapy for HCV infection/non-A, non-B hepatitis. (Updated on 25-MAR-2003 to correct PR field.)

                                                                                                                                                                                                                                                                                                                                                                                                                     It is a double-stranded nucleotide sequence of the open reading frame (ORF) (tag a) extending through clones 12f to 15c of hepatitis C virus (HCV) conNa. It can be used to make oligomeric DNA hybridisation probes t detect the presence of HCV nucleida in samples. The polypeptide(s) it encodes could be used as immunoassay reagents and vaccines and to generate antibodies useful in diagnosis and passive immunotherapy for HCV incleid on 25-MAR-2003 to correct PR [ield.) (Updated on 25-MAR-2003 to correct PI field.)

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       LysAspleuValG'yTrpProAlaProGlnGlySerArgSerLeuThrProCysThrCys
                                                                                                                                                                               The sequence shows a composite hepatitis C virus (HCV) cDNA, derived be aligning clones K9-1 through 15e in 5'-3' direction. The cDNA encodes antigens which react with antibodies in patients with non-B hepatitis (NANBH). The cDNA can be used to design probes, or to synthesise polypeptides, which are used to diagnose HCV-induced NANBH, to raise antibodies for immunoassay or treatment, or to produce vaccines. See also AAP90288, and AAN90333.

(N.B. This record was resulmitted to correct errors in the sequence.) (Updated on 25-MAR-2003 to correct PR field.)

They can also be used in an anti-HCV vaccine or for the production of anti-HCV antibodies which can be used for passive immuroprophylaxis. The antigens consistently identify more HCV positive serum samples with a high degree of specificity. See AAG98222-14 and AAR81939-51. (Updated on 25-MAR-2003 to correct PF field.)

The HCV is characterized by a positive stranded RA genome which has 40% homology at the polypeptide level to a HCV polyprotein. The antisense polynucleotide binds to collular polynucleotide which enhance and/or are required for viral infectivity, replicative ability or chronicity. The antisense polynucleotides may also be designed to bind with high specificity, to be of increased stability, to be stable and to have low toxicity. The composition also comprises an agent which causes viral RAM to be luactive. The composition is used for preventing HCV cpN sequence, which is used in the
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         41 AlaGinThrPheLeuAlaThrCyslleAsnGlyValCysTrpThrValTyrHisGlyAla

The invention provides two new isolates of hepatitis C virus (HCV), JI and JT. These two isolates comprise nucleotide and amino acid sequences that are distinct from the HCV isolate HCV-1. The nucleotide sequences may be used to detect non-A, non-B HCV (NANBH) polynucleotides by hybridisation for diagnosis of NANBH infections. They may also be used to screen blood donners, donnated blood and blood products for this infection. The isolates may also be used to isolate other naturally occurring variants of the virus. The polypeptides may be used as a vaccine for present sequence represents the nucleotide sequence of HCV-1 ORF.
                                                                                                                                                                                                                                                                                                                                                       /transl_except= (pos:1588..1589; aa:Leu)
/note= this codon has an apparent 1 nucleotide deletion,
which alters the reading frame.
/transl_except= (pos:1647..1650; aa:Pro)
/note= this codon has an apparent 1 nucleotide
insertion, which alters the reading frame; insertion, is not indicated in the sequence
present in the formal sequence listing of the
specification"
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Hepatitis C Virus isolates, useful for diagnosis of hepatitis

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    GEV CDNA Libraries were constructed using pooled serum from a chimpanzee with chronic HCV infection. A Lambda gtll library was screened with probes derived from previously isolated clones. The ORF is derived from the overlapping clones bilds, ag30a, CA205a, CA200a, CA216a, pi4a, CA167b, CA166b, CA84a, CA59a, K9-1, 265, 131, 121, 141, 11b, 7f, 8h, 33c, 40b, 37b, 35, 36, 81, 32, 33b, 25c, 14c, 8f, 33f, 33g, 36c, 35f, 19g, 26g, 15e, b5a and 16fh. These clones extend the sequence of the HCV genome reported in EP-378216. The upstream region from nucleotides 319 to 41348 (=1.1667 in this file) is covered by clones Dilda, 18p, ag30a, CA205a, CA206a, CA206a, Andrew CA206a, CA20

A cell line infected with this virus can be used as a source of antidems. The antidem is useful for preparing vaccines for treating viral infections. See also AAQ10567.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  81 LysAspLeuValGlyTrpProAlaProGlnGlySerArgSerLeuThrProCysThrCys 100
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  AlaGlmThrPheLeuAlaThrCysIleAsnGlyValCysTrpThrValTyrHisGlyAla 60
                                                                                                                                                                           The specification describes a pharmaceutical composition which comprises a hepatitis C virus (HCV) antisense pelynucleotide. The HCV is characterized SRN genome which has 40% homology at the polypeptide level to a HCV polypection. The antisense polynucleotide binds to cellular polypudiectides which enhance and/or are required for viral intectivity, replicative ability or chronicity. The antisense polynucleotides may also be ability or chronicity. The antisense polynucleotides may also be to be stable and to have low toxicity. The composition also comprises an agent which causes viral RNA to be indective. The composition is used for preventing HCV replication in a system. The present course of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         141 GiyGlyProLeuLeuCysProAlaGlyHisAlaValGlyIlePhcArgAlaAlaValCys
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     ThrangGlyValAlaLysAlaValAspPheIleProValGluSerLeuGluThrThrMet
                             polynucleotide which is complementary to or corresponds to a sonse
strand of the virus genome, and selectively hybridises to it

Reagents for isolating, amplifying and detecting ECV polynucleotide(s) - used to monitor spread of blood-borne non-A, non-B hepatitis virus infection and screen blood samples for

Disclosure, Fig 1; 67pp; English

The sequence is a composite of ECV cDNA from HCV1, a prototypic HCV. The sequence is based upon sequence information derived from a no. of HCV cDNA clones, which were isolated form a no. of HCV cDNA libraries, including the "c" library prosent in lambda quill complete, including the "c" library prosent in lambda quill complete, and from human serum. The HCV cDNA clones were isolated by mothods described in WO9014436.

The clones from Which the sequence was derived are Sclone32, The clones from Which the sequence was derived are Sclone32, chala, 18a, ag30a, CA205a, CA290a, CA216a, pil4a, CA167b, CA156e, chala, 18a, ag30a, CA50a, WF-1 (also called K9-1), 256, llt, 64 and pillift, 14a, 84, 334, 334, 339, 256, llt, 256, llt, 256, llt, 18a, 16jh, 6k and pillift, 14a, 84, 334, 334, 334, 256, llt, 256, (Updated on 25-MAR-2003 to correct PA field.) (Updated on 25-MAR-2003 to correct P1 field.)

Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   ALIGNMENTS
